

U.S. Hospital Costs and Resource Use for Kids with CHD

In a recent study, CDC researchers found that in 2009, hospitalized U.S. children and adolescents who had a congenital heart defect (CHD) had more expensive hospital stays than those who were hospitalized without a CHD. The most expensive hospital stays were for infants, children, and adolescents with critical congenital heart defects (CCHD). This information might help improve public health practices and healthcare planning to adequately serve people of all ages with a CHD.
